The National Textbook Project

By issuing the textbooks for the third year of each educational cycle, the Educational Center for Research and Development will have completed the third and last installment of books called for by the New Curricula. We are placing these books in the hands of students with the great hope that we are moving, step by step, toward the goal of acquiring sound learning, using sophisticated educational means and up-to-date methodology that encourage and reinforce individual thinking and research, acquisition of skills, development of ethical and national attitudes, the feeling of national belonging as well as the feeling of belonging to humanity at large.

The on-going revolution in information, communication and educational-aids technology has undoubtedly limited the role of the textbook and lowered the rank it used so recently to occupy. However, in our society and in many other societies, the textbook remains the basic means of education, and it is our duty to exert our utmost effort and care to come up with the best product as to form and content. Yet we should not lose sight of the fact that the textbook is not sufficient by itself but should rather be used as a stepping stone to access other sources of information. What is important is to keep a clear vision and maintain the right course toward our objective. The means should not turn into the end and the student should always remain the focus of the learning/teaching process.

No one ignores or denies the fact that textbook writing requires very high academic and educational qualifications and very wide field experience. The authors committees undeniably possess such qualities. Yet the textbooks of the last two years contained some negative aspects. Such is the nature of human work, no matter how good the intentions or how great the effort extended. Here constructive criticism constitutes a real contribution to raising the standard of authorship, minimizing errors and filling gaps. We say that, with all due appreciation and respect to all those who have contributed to the success of this project.

The Educational Center for Research and Development is embarking this year on a process of evaluating the New Curricula and related textbooks, teacher training courses and student achievement. This is a natural and necessary step now that the new system has been put into effect. This process aims at identifying the curricular objectives that have been achieved as well as those that have not been achieved, with a view to proceeding with the positive aspects and correcting the negative ones.

As part of this correction process, we plan to review the versions that have been issued in order to secure good textbooks for our students, who always deserve the best.

Preface

"We do not narrate mathematics... we construct it..."

We believe that this teaching concept reflects the will to respect the student as a human being; it is no longer a matter of imposing information on him but presenting him with the one he demands. Our main objective in this book is to direct the student to become an information seeker.

Material covered in the following chapters includes:

- The **Introduction**, in which the student is reminded of what he has learned and what he will learn.
- The **Activities**: In this phase, the student is confronted with situations that urge him to pose questions, conclude, and exchange ideas with his classmates and defend them.
We think that this is the most important phase of using the national textbook.
The role of the teacher is clearly defined in the Pedagogical Guide.
- The **Text**: This is the phase of systematization where teaching is put into order through the ideas proposed by student groups.
- The **Focus**: This is a place where students can find the main points of the chapter summarized.
- The **Exercises**: Devised to consolidate the already-acquired notions.
- The **Self-evaluation**: A set of questions, put by students, after their acquisition of new material. Answers to the proposed questions are given at the end of the book. At this stage, the student is held responsible for his work. It is only up to him to judge the degree of comprehension of the notions presented so far.
- The **Problems**: Place of relocating the student's new and old acquisitions. It is a wide and varied field of applications.
- **Just for fun**: Place where the posed problems are less classical and more extracurricular. The essential interest is not in the solution of these problems but in the attempts made towards their solution in a lively atmosphere.

At the end of this work, we hope to reach most of the goals that we set for ourselves. Nevertheless, the results depend heavily on how the teachers will use this book.

The authors

Table of contents

1. Lines and circles	9
2. Proportion	21
3. Inscribed quadrilaterals	30
4. Lines in a coordinate system	38
5. Thalès' property	49
6. Systems of equations.	56
7. Systems of inequalities	62
8. Similar triangles	67
9. Real numbers.	75
10. Translation and vectors	84
11. Algebraic expressions	90
12. Trigonometric relations	101
13. Analytic geometry	109
14. Statistical surveys.	116
15. Solids	123
